

ABSTRACT

Medicament comprising, in a pharmaceutically acceptable vehicle, an anti-psychotic or an antidepressant (A), which, on its own, has an undesirable effect of a gain in body weight or sedation, and an antagonist and/or inverse agonist (B) of the histamine H₃ receptor, the antagonist and/or inverse agonist of the histamine H₃ receptor being present in a therapeutically effective amount for ensuring at least one of the following three effects: suppression or at least limitation of the undesirable effect of weight gain, suppression or limitation of the undesirable effect on alertness, epilepsy/convulsions, increase in the procognitive effect of the treatment. Use of such an antagonist or inverse agonist for the preparation of a medicament which is to ensure at least one of the said three effects in a patient treated by such an antipsychotic or antidepressant.
